

BBB Meeting in [matrix] Element

realisation variants

Content

- Variant 01
 - Integration via /addwidget
 - PoC available
- Variant 02
 - Integration via button / as widget in the chat room

Variant 01

- BigBlueButton (BBB) video conference is integrated via `/addwidget` as an extension in the chat room [matrix], Element client
- PoC BBB-matrix-widget service available at:
 - <https://greenlight-dev.fairteaching.net/bbb-matrix-widget/webapp/>
 - to be clarified / implemented: Authentication
 - Repo PoC: <https://git.fairkom.net/hosting/fairmatrix/matrix-conf-ext>
 - Microservice: <https://git.fairkom.net/hosting/fairmatrix/matrix-conf-ext-svc>

/addwidget

- /addwidget
<https://greenlight-dev.fairteaching.net/bbb-matrix-widget/webapp/>
- [matrix], Element client: the command must be entered by the room admin in the chat bar and executed by pressing Enter

11:17  Lisa hat das Widget Custom hinzugefügt

 /addwidget <https://greenlight-dev.fairteaching.net/bbb-matrix-widget/webapp/>

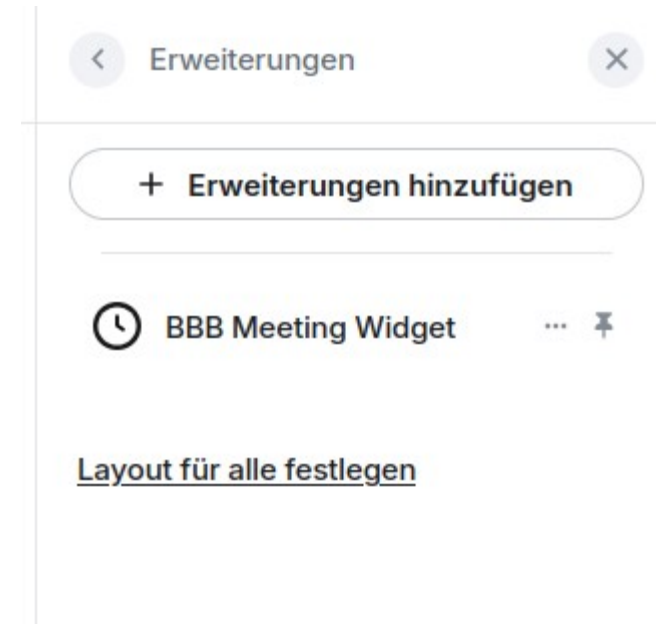

Authorise rights

- the room admin must authorise the rights for the widget

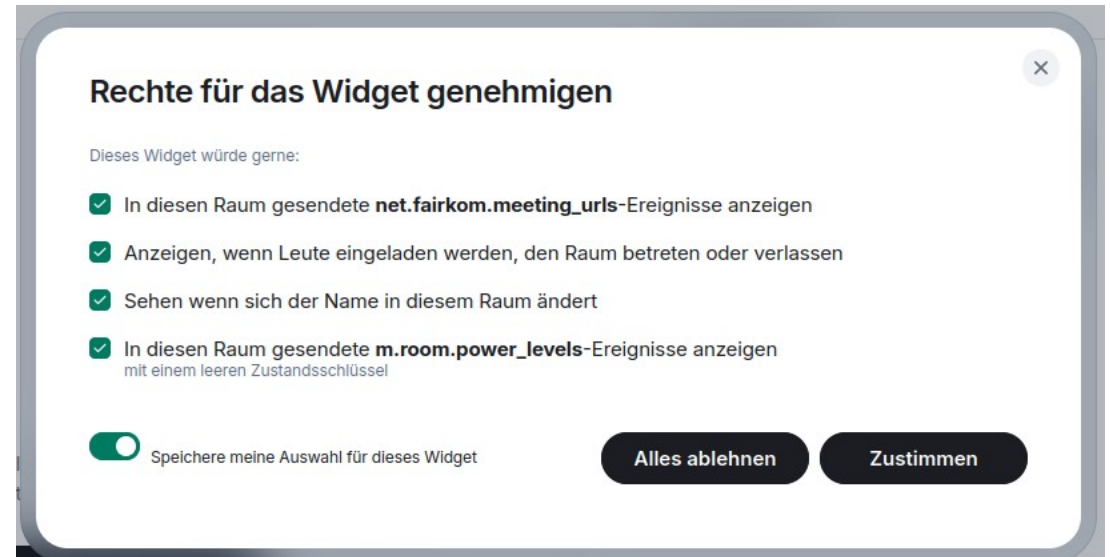

Extension

- Room info > Extensions
- the BBB Meeting Widget will then be visible to all participants

Consent

- all participants must give their consent to use the widget
- until now, consent has been required each time the widget is launched

The screenshot shows a consent dialog box titled "Rechte für das Widget genehmigen". It lists four permissions that the widget would like to use, each with a green checkmark icon. At the bottom, there is a toggle switch for "Speichere meine Auswahl für dieses Widget" and two buttons: "Alles ablehnen" and "Zustimmen".

Rechte für das Widget genehmigen

Dieses Widget würde gerne:

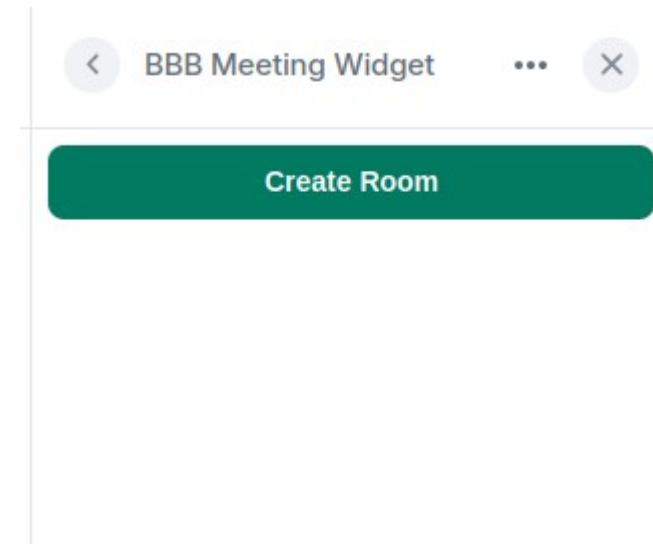

- ✓ In diesen Raum gesendete **net.fairkom.meeting_urls**-Ereignisse anzeigen
- ✓ Anzeigen, wenn Leute eingeladen werden, den Raum betreten oder verlassen
- ✓ Sehen wenn sich der Name in diesem Raum ändert
- ✓ In diesen Raum gesendete **m.room.power_levels**-Ereignisse anzeigen
mit einem leeren Zustandsschlüssel

☒ Speichere meine Auswahl für dieses Widget

Alles ablehnen Zustimmung

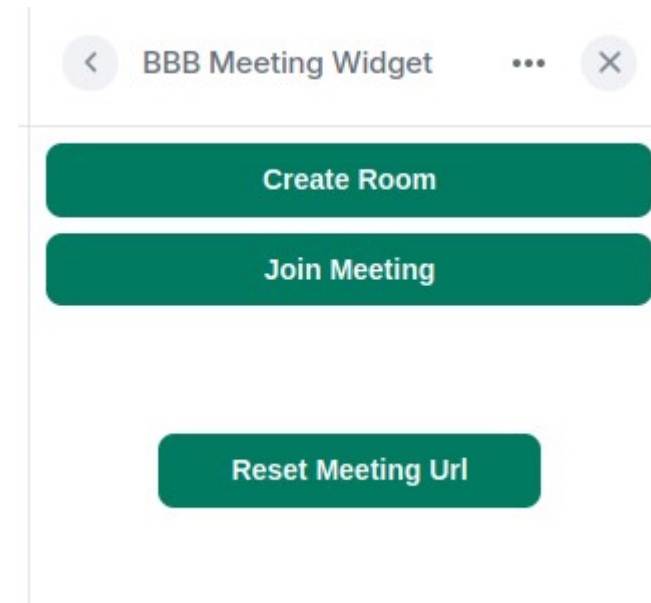

Create video conference room

- the room admin can create a video conference room (Create Room)
- the rights must be authorised again

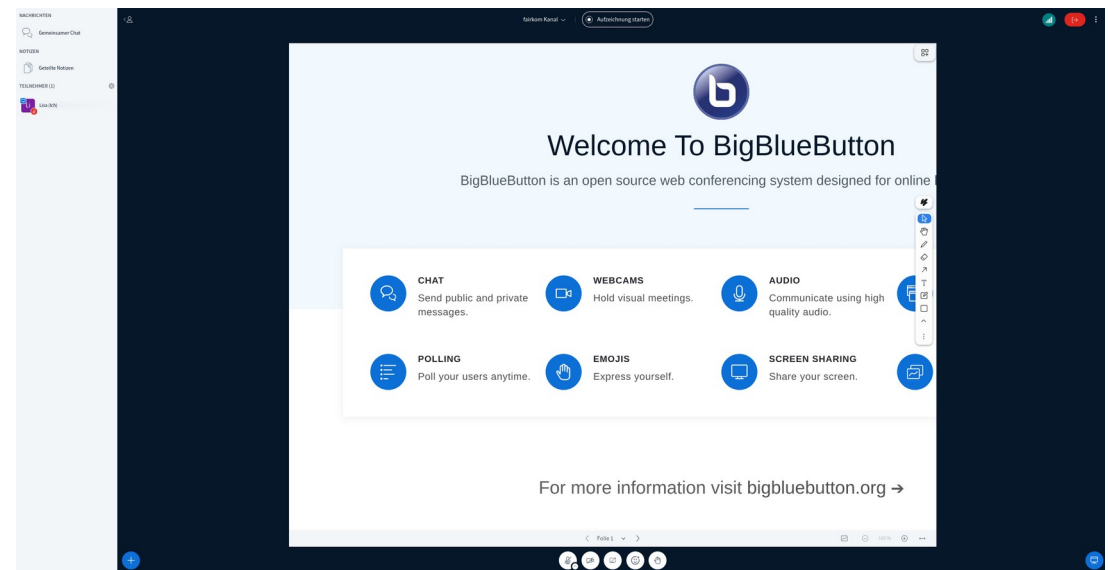

Enter the video conference room

- participants can join the video conference room (Join Meeting)
- an individual link is created for each participant
- the roles of the participants are transferred from [matrix] to BBB
- to be clarified: generic link for participants outside [matrix]

New tab

- the BBB conference opens in a new tab
- Username is transferred
- a tab: [matrix] Element client
- a tab: video conference BBB

Overview 01

Advantage

- Variant immediately available / usable
- BBB conference can be easily added to them room, participants can join
- name and authorisation are transferred

Disadvantage

- Consent of all participants required
- display in new tab, can also offer advantages for usability
- Element chat \neq BBB chat

Variant 02

- BigBlueButton (BBB) video conference can be started via button in the chat room [matrix], Element client
- BBB conference opens as a widget within the chat room
- Notes implementation (matrix-js-sdk):
<https://github.com/toger5/matrix-js-sdk/commit/b261a3f9324afa6547423ebd38912086ad1b0c3e>
- matrix-spec-proposal:
<https://github.com/matrix-org/matrix-spec-proposals/blob/toger5/matrixRTC/proposals/4143-matrix-rtc.md>

Procedure

What is required?

- Problem: one room > one RTC session (type call)
- Multiple RTC sessions (of different types) must be supported per room (js-sdk matrixRTCSessionManager.ts)
 - video conference and whiteboard session in parallel

How can this be achieved?

- update rust- and js-sdk-implementation
- adapt to the format of the state key from the specification (user_device_app) (not: user_device)
- adapt livekit / room identity

state key format

- from the spec m.rtc.member state event
- at the moment: `user_device`
- needs to be: `user_device_app`
 - map rooms to application > rtc sessions
 - user id
 - device id
 - application
- longterm: user id + hash

Decision

- BBB of type `org.bigbluebutton.call`
 - we start with it
 - parallel call and BigBlueButton sessions are possible
 - BigBlueButton does not need to add encryption
- BBB of type `m.call`
 - possible step in the future
 - Interoperability with ec (Element client?)

Flow design

Element Web needs to support recognising and displaying different RTC sessions and provide a way to join them.

Question(s) for the future:

- What will the creation / participation in Element Web look like?
- How will it be indicated that two sessions are running in parallel?
- Example: Video call button + dropdown for further widgets (whiteboard)
- Focus on easy maintainability (general approach)
- Element Web should support RTC sessions in a smart way (without many custom rules)

Where is it stored which widget must be used for which type of RTC session?

Idea 1

- in the widget metadata: the widget informs the client in its state event that RTC sessions of application type X can be processed
- if a session of type X takes place, the client automatically opens the correct widget
- Problem: only one widget can be used per session type (it is not possible to use two whiteboards simultaneously)
- Advantage: no need to change the membership state events, no conflict can arise

Idea 2

- the member events that make up the RTC session (state events per session) refer to which widget can be used to open the session
- Problem: different members could request different widgets but be in the same RTC session
- Solution: the widget ID could be part (equivalent) of the call_id
 - specify this as part of the session identity
 - if a different widget_id is used, a member ends up in a different real-time session

Overview 02

Advantage

- BBB as video conference directly in [matrix], Element client implemented
- several widgets (video conference + whiteboard) can be used in parallel in a chat room
- easy to maintain

Disadvantage

- Preparatory work required to be able to select widgets
- Resources of several teams required
- compatibility issues due to data structure change
